

MOTIVATION

GRAPHS ARE EVERYWHERE

REAL-WORLD GRAPHS ARE SPARSE

- In real-world graphs: $m \ll n^2$, with m the number of edges and n the number of nodes
- Sparse format** encoding

REPRESENTATION LEARNING

- Non-Euclidean** data structure
- Machine learning tasks: node classification, link prediction, etc.
- Deep-learning** based approaches show great results^[1]

Graph Neural Networks in Scikit-network

SCIKIT-NETWORK^[2]

- Python package for **machine learning on graphs**
- Performant** and **easy** to use:
 - Based on efficient sparse graph representation
 - Reproduces Scikit-learn^[3] `fit_transform()` pipeline
- Real-world graph algorithms: clustering, ranking, embedding, visualisation, etc.

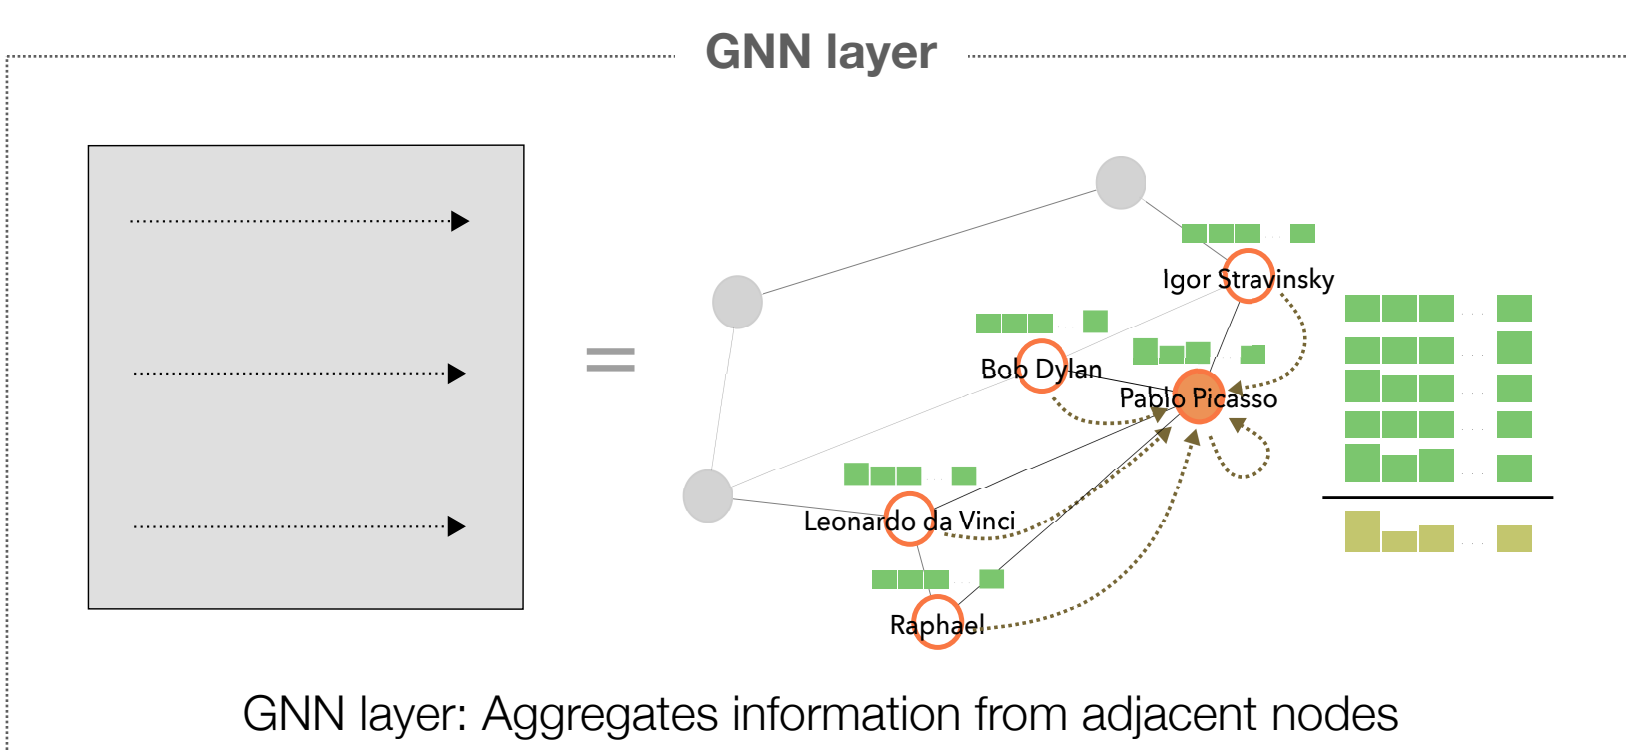

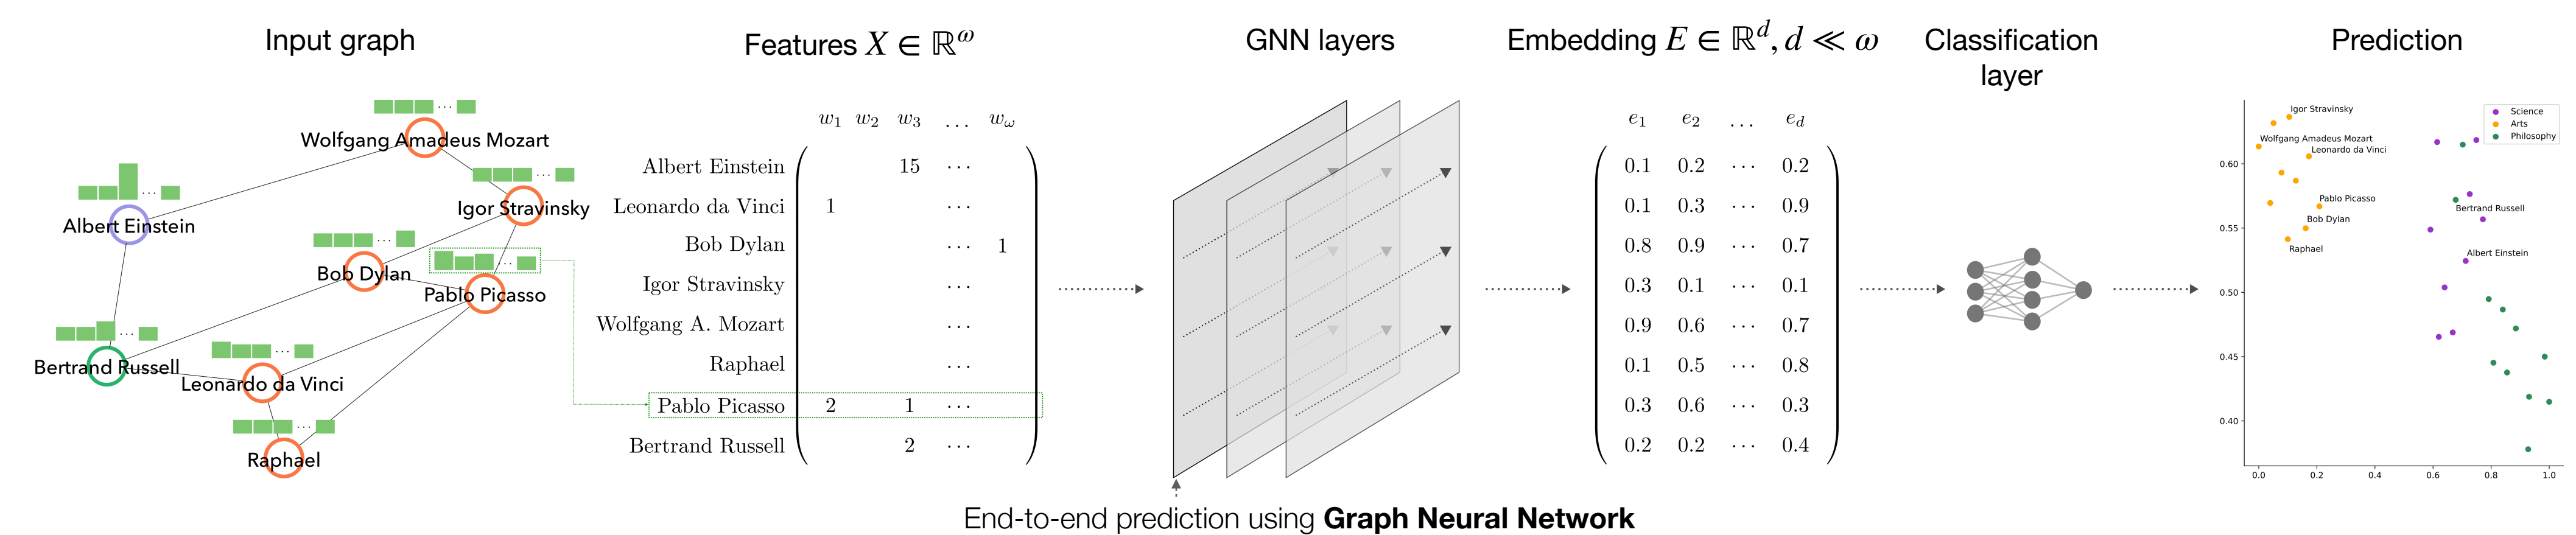

GRAPH NEURAL NETWORKS

- Graph Neural Networks (GNN)** approaches are extending neural networks to graph structures, in order to learn embeddings
- Gather** and **aggregate** information

$$H^{(l+1)} = \sigma(\tilde{A}H^{(l)}W^{(l)} + b^{(l)})$$

APPLICATIONS

- Enriched graphs** can provide valuable insights
- Interdisciplinary** applications: perspectives between computer sciences and the social sciences
- Several remaining **challenges** about scalability, interpretability and fairness

Contribution

- Fast** and **scalable** implementation
- Reduce memory footprint thanks to **sparse formats**
- GNNs with **dependencies limited** to NumPy and SciPy
